

Specializing in Furnace Maintenance Equipment

KT-Grant manufactures an assortment of different style of buckets that easily mount to their equipment. Many of the machines incorporate a hydraulic hammer for removing and breaking up heavy debris, scale build-up, and refractory linings. The bucket attachments are a perfect companion with the hydraulic hammer, in that the bucket can remove the material from the work area after it has been broken-up by the hydraulic hammer .

Many of the bucket designs incorporate one of the variety of quick -change features, from the very basic hammer shank design, that is simply installed in the hydraulic hammer chuck, in place of the hammer's impact bit.

A quick mount 4" shank is suitable for machines that are equipped with the specially designed quick-change box, that allows the use of a variety of different tools, that can be changed quickly, by removing a single fastening pin.

One of the most popular styles of buckets, the flapper design, is made to install on the end of the machine's flapper, replacing the hydraulic hammer completely. It is mounted to a pin, and secured in place with two heavy duty bolts.

All of KT-Grant's bucket designs come in a wide assortment of bucket widths, from very narrow widths for tight areas, to widths exceeding 36", depending on their special applications. Custom shank lengths are available for extensive reach.
